Plane selection - Each flight simulator game offers a different matrix of planes you can fly. A World War II game will have historic planes from that time, while games that in today's time will have more modern jets. Some games even have the ability to create their own flyer. Detail level - The graphics in your game make all the difference. While some of it depends on the capacity of your game system, the development of the game will also play a factor. The more realistic and detailed the graphics are, the more immersive the experience becomes. Additions - At their most basic all flight simulators are the same. But it's the additions that really distinguish one game from another. If variety is important to you, look for games with lots of different airports and landscapes. You can also change the experience by manipulating weather conditions, cargo weights, and aircraft skins. Of all the earliest VR technology applications, military vehicle simulations have probably been the most successful. Simulators use sophisticated computer models to replicate a vehicle's capabilities and limitations within a desktop - and secure - computer station. Possibly the most well-known of all simulators in the military are the flight simulators. The Air Force, Army and Navy all use flight simulators to train pilots. Training missions can include how to fly in combat, how to recover in an emergency or how to coordinate air support with ground operations. All three branches use hardware developed by the military as well as from third-party vendors. Because of this, many of the flight simulators they use are different from each other. Often this can cause difficulties when linking systems - simulated enemies may not appear in the same space for multiple pilots, for example. At present, there is a large to create better networks among simulators to facilitate coordinated training missions. Although flight simulators can vary from one model to another, most of them have a similar basic setting. The simulator sits on top of either an electronic motion base or a hydraulic lifting system that reacts to user input and events within the simulation. When the pilot controls the aircraft, the module he sits in twists and tilts, giving the user haptic feedback. The word haptic refers to the sense of touch, so a haptic system is one that gives the user feedback he can feel. A joystick with force feedback is an example of a haptic device. Some flight simulators contain a fully sealed module, while others only have a series of computer monitors arranged to cover the pilot's field of view. Ideally, the flight simulator will be designed so that when the pilot looks around, he sees the same controls and layout as he would in a real aircraft. Since one aircraft can have a completely different cockpit layout than another, there is not a perfect simulator choice that can accurately represent each vehicle. Some training centers invest in multiple simulators, while others sacrifice accuracy for convenience and cost by sticking to a simulator model. In the next section we will look at VR simulators for ground vehicles and submarines. Submarines.
